WIRASINGHE, S. C., AND P. N. SENEVIRATNE, *Rail Line Length in an Urban Transportation Corridor*, 237–245

Subject Index

A

Adams' delay, 272–286
Akaike likelihood ratio index, 133–136
Algorithm
  approximation, *p*-center problems, 130–133
  Neuts', 65–79
  optimally locating single facility, 107–116
  simulation, peak period traffic congestion, 164–181
  switchoff, critical, and stepdown, 130–133
Allocation problem, vehicle, dynamic, stochastic model of, 117–129
Approximate, closed form moment formulas, for bulk arrival, bulk service queues, 13–23
Arrivals, Poisson and non-Poisson, iterative algorithms for bulk arrival, bulk service queues with, 65–79
Automobile usage data, extrapolating, to long time periods, 48–51

B

Bibliographic section, 59, 137, 220, 290
Bulk arrival, bulk service queues
  approximate closed form moment formulas for, 13–23
  iterative algorithms for, with Poisson and non-Poisson arrivals, 65–79
Bus services, subsidies to, analytic assessment of, 200–212

C

Constraint qualification, for dynamic traffic assignment model, 55–58

D

Decisions, individual, collective effects and, in simulated traffic system, 258–271
Degrees-of-freedom, derivation of, correction for ρ^2, 133–136
Delay, average, at unsignalized intersection with two major streams each having a dichotomized headway distribution, 272–286
Demand, continuously distributed, network median problems with, 213–219
Distribution, dichotomized headway, of two major streams, average delay at unsignalized intersection with, 272–286

E

Estimation, constrained, of direct demand functions and trip matrices, 143–152
Euclidean distance location-allocation problems, with uniform demands over convex polygons, 107–116

F

Fleet sizing, under production cycles and uncertain travel times, 227–236
Freight flows, sequential shipper-carrier network model for predicting, 80–91

H

Hub facilities, interacting, location of, 92–106

I

Intersection, unsignalized, average delay at, with two major streams each having dichotomized headway distribution, 272–286
Iterative algorithms, for bulk arrival, bulk service queues, with Poisson and non-Poisson arrivals, 65–79

L

Length, rail line, in urban transportation corridor, 237–245
Less-than-truckload motor carrier networks, local improvement heuristic for design of, 246–257
Local improvement heuristic, for design of less-than-truckload motor carrier networks, 246–257
Location, interacting hub facilities, 92–106
Location-allocation problems, Euclidean distance, with uniform demands over convex polygons, 107–116
Long time periods, extrapolating automobile usage data to, 48–51

M

Model
  bus services, subsidies and, 200–212
  congestion at critical bottleneck, 52–55
  constrained estimation of direct demand, 143–152
  dynamic vehicle allocation problem, 117–129
  empirical, weekly shopping activity, 24–36
  fleet sizing, 227
  integrated supply and demand, 37–47
  operational, for weekly activity pattern, 24–36
  peak period traffic congestion, 287
  sequential shipper-carrier network, 80–91
  single hub system, 92–106
  stochastic equilibrium, 287–289
  traffic assignment, constraint qualification for, 55–58
  traffic congestion, 164–181
  traffic flow, "follow-the-leader," 52–55
  transportation systems, 37–47
  travel time, urban freeways, 153–163
  two-hub, in plane, 92–106
  weekly activity pattern, 24–36
  zonal route design for transit corridors, 1–12
Motor carrier networks, less-than-truckload, local improvement heuristic for design of, 246–257

N

Network
  median problems with continuously distributed demand, 213–219
  p-median, 213–219
  less-than-truckload motor carrier, local improvement heuristic for design of, 246–257
  random time-dependent travel times, 182–188
  sequential shipper-carrier, model for predicting freight flows, 80–91

O

Optimal transportation systems planning, conceptual framework for, with integrated supply and demand models, 37–47

P

p-Center problems, in plane, 130–133
p-Median network, 213–219
Peak period traffic congestion, with elastic arrival rates, dynamic model of, 164–181
Poisson and non-Poisson arrivals, iterative algorithms for bulk arrival, bulk service queues with, 65–79
Problems, network median, with continuously distributed demand, 213–219
Production cycles, fleet sizing under, and uncertain travel times, 227–236
Public transit, optimal frequencies and fares for, 37–47

R

Rail line length, in urban transportation corridor, 237–245
Railyards, static blocking at, sorting implications and track requirements, 189–199
Random time-dependent travel times, fastest path through network with, 182–188
Route design, zonal, for transit corridors, 1–12

S

Service functions, urban freeways, empirical study, 153–163
Shipper-carrier network, sequential, model for predicting freight flows, 80–91
Simulated traffic system, individual decisions and collective effects in, 258–271
Smeed's analysis, 52–55
Static blocking, at railyards, sorting implications and track requirements, 189–199
"Stochastic Equilibrium Model of Peak Period Traffic Congestion" by Andre de Palma, Moshe Ben-Akiva, Claude Lefevre, and Nicolaos Litinas, comment on paper, 287–289
Stochastic model, dynamic vehicle allocation problem, 117–129
Subsidies, to bus service, analytic assessment of, 200–212

T

Time-dependent travel times, random, fastest path through network with, 182–188
Track requirements, sorting implications and, in static blocking at railyards, 189–199
Traffic
  assignment model, dynamic, constraint qualification for, 45–58
  congestion, peak period, with elastic arrival rates, dynamic model of, 164–181
  flow model, "follow-the leader," 52–55
  system, simulated, individual decisions and collective effects in, 258–271
Transit corridors, zonal route design, 1–12
Travel times
  random time-dependent, fastest path through network with, 182–188
  uncertain, production cycles and fleet sizing under, 227–236
  variability, 258–271
Trip matrices, constrained estimation of direct demand functions and, 143–152

U

Urban freeways, service functions for, 153–163
Urban transportation corridor, rail line length in, 237–245

V

Vehicle
  allocation problem, dynamic, stochastic model of, 117–129
  starting later and reaching destinations earlier, circumstances, 52–55

W

Weekly activity pattern, dynamic model of, 24–36

Z

Zonal route design for transit corridors, 1–12

Contents, Volume 20

Number 1 **February 1986**

PETER G. FURTH—Zonal Route Design for Transit Corridors 1

WARREN B. POWELL—Approximate, Closed Form Moment Formulas for Bulk Arrival, Bulk Service Queues 13

MOSHE HIRSH, JOSEPH N. PRASHKEA, AND MOSHE BEN-AKIVA—Dynamic Model of Weekly Activity Pattern 24

CAROLINE S. FISK—A Conceptual Framework for Optimal Transportation Systems Planning with Integrated Supply and Demand Models 37

ABRAHAM D. HOROWITZ AND CARLOS F. DAGANZO—Extrapolating Automobile Usage Data to Long Time Periods 48

Technical Notes

Moshe Ben-Akiva and André de Palma—Some Circumstances in Which Vehicles Will Reach Their Destinations Earlier by Starting Later: Revisited 52

MALACHY CAREY—A Constraint Qualification for a Dynamic Traffic Assignment Model 55

Bibliographic Section 59

Transportation Section Officers and Council Members 60

Information to Contributors 61

Editorial Policy 62

Society and Section Meetings 63

Number 2 **May 1986**

WARREN B. POWELL—Iterative Algorithms for Bulk Arrival, Bulk Service Queues with Poisson and Non-Poisson Arrivals 65

TERRY L. FRIESZ, JOEL A. GOTTFRIED AND EDWARD K. MORLOK—A Sequential Shipper-Carrier Network Model for Predicting Freight Flows 80
